Nutritional value	18
Agri-environmental schemes	19

Catch and cover crops are widely used across all sectors of crop production for many reasons, including their ability to improve key soil functions, add organic matter and cycle nutrients for the following crop.

We are very pleased to offer our own range of catch and cover crop mixes specifically designed to maximise these benefits.

Technical justification is the driver in the selection of each species. The key aim with each mix is to provide as much diversity as possible, while considering cost, reliability and confidence in performance.

Our core **over-winter mixes** all use the same eight species, with ratios of each adjusted according to the situation in which they are placed. This means we work consistently with species we are confident deliver the intended outcomes.

Our **catch crop mixes** present a great opportunity for those with more restrictive rotations to gain improvements in soil health, but also an additional opportunity for those already using cover crops. Where grazing of cover crops by livestock is planned please refer to guidance notes on page 17.

Our agronomists have considerable experience of using these crops to benefit growers and provide the correct solution to match their objectives.

#### Certified organic seed mixes can be supplied upon request.

Please always take the opportunity to discuss with your local Hutchinsons contact and consider the many important agronomic factors that may be relevant to you before deciding.

t: 01526 832771 ( e: seedorders@hlhltd.co.uk ( www.hutchinsons.co.uk (

# **Species description**

	TARGET AND AN ADDRESS AND ADDRESS A
Linseed	Thin, upright plant that is easy to establish and develops a thin tap root with fine, fibrous branches that condition soils and extract moisture well. Not frost tolerant but will stand through the winter.
Buckwheat	Very fast growing, upright annual plant that is effective at scavenging phosphate from a fine, fibrous root system. Can reach maturity in eight - ten weeks, providing a pollen and nectar source. Helps suppress weed growth but will die at the first sign of frost. Do not graze pre-frost as it can cause photosensitivity in livestock.
Phacelia	A fast establishing annual which covers the ground quickly with vigorous top growth and develops a moderately extensive root system. It is also quick to reach maturity and is very frost tolerant. Will need managing to prevent seed return. Good at holding nitrogen.
Daikon radish (tillage)	Annual with a very thick, deep tap root which can be effective at breaking through tight or compacted soils. Radish species are excellent nitrogen scavengers. Intermediate top growth which covers the soil well to compete with weeds. Not winter hardy but good persistence, may bolt if drilled too early.
Fodder radish (oil)	Annual radish with larger top growth than Daikon but a narrower, deep penetrating root.
Brown mustard	Produces a deep tap root and very short leafy top growth but can be slow to develop. The C:N ratio of brown mustard is much lower than that of white mustard meaning it releases nitrogen much quicker. It is also much more winter hardy than white mustard.
White mustard	Faster growing mustard, more suitable for shorter term catch crops. Will develop woody stem growth if left for longer periods, increasing the C:N ratio meaning slower nutrient release and residue may block drilling equipment.
Hairy vetch	Annual legume with a sprawling, creeping growth habit. Vigorous root and top growth with good frost tolerance. Low C:N ratio.
Crimson clover	Rapidly growing annual clover with broad leaves. Low growing. Limited frost tolerance. Low C:N ratio.
Berseem clover	Fast establishing clover with a finer vigorous root system and narrower leaves. Very low frost tolerance. Ideal for shorter term catch crops and companion planting.
Japanese reed millet	Annual C4 warm season grass. Grows rapidly in warm temperatures with less water requirement. Large, thick root mass. Low C:N ratio when terminated early.

# **MaxiCover**

### Seed Rate: 12.5 kg/ha (25kg pack)

A multi-purpose over-winter mix which suits a wide range of situations and soil types.

MaxiCover provides fantastic diversity in root growth.

Its varied root depth and architecture helps to aggregate soil and create drainage channels.

Various types of plant canopy offer excellent soil armour and weather protection.

The mix contains legumes, forbs and brassicas which provide a varied food source for soil microbes.

The diversity of the mix and a low inclusion rate of each plant type reduces the risk of exacerbating rotational pest or disease issues.

This mix should be drilled as soon as possible in the summer, following harvest of the previous crop, and no later than early September.

#### SPECIFICATION

SPECIES	% (seeds/m²)
Linseed	26.3
Buckwheat	7.3
Phacelia	13.9
Daikon radish	2.9
Fodder radish	5.1
Brown mustard	16.1
Hairy vetch	3.6
Crimson clover	24.8

t: 01526 832771 ( e: seedorders@hlhltd.co.uk ( www.hutchinsons.co.uk (

SPECIES	% (seeds/m²)
Linseed	40.2
Buckwheat	4.8
Phacelia	8
Daikon radish	8
Fodder radish	6.4
Brown mustard	12.9
Hairy vetch	3.6
Crimson clover	16.1

# **MaxiRooter**

#### Seed Rate: 12.5 kg/ha (25kg pack)

MaxiRooter can be used to alleviate minor shallow compaction or slumping issues by favouring species with larger, vigorous root systems.

Linseed has a very fibrous root mass which spreads well throughout the upper soil layer. This is used in combination with higher levels of the deeper rooting brassica species, in particular Daikon radish (also known as tillage radish).

The aim with MaxiRooter (more so than with the other mixes) is to save a cultivation pass, using 'roots not iron' to repair damage and create a friable soil for establishment of the following crop.

Careful examination of the soil prior to planting this mix will help to determine whether the intended outcome is achievable or if targeted subsoiling should be used alongside this cover crop.

This mix should be drilled as soon as possible in the summer, following harvest of the previous crop, and no later than early September.

(2) t: 01526 832771 e: seedorders@hlhltd.co.uk

www.hutchinsons.co.uk

# **MaxiVeg**

### Seed Rate: 12.5 kg/ha (25kg pack)

MaxiVeg been designed for those who do not want to use brassicas in cover crop mixes.

For example, those who regularly grow brassica cash crops in rotation and have associated issues with soil borne pathogens, must avoid brassicas in cover crops so the problem doesn't get worse.

This mix is brassica free but keeps the remaining five species of the over-winter range. Therefore it still provides a good level of plant diversity and number of key benefits, including Nitrogen fixing legumes.

**MaxiVeg** is suitable for any soil type and should be drilled as soon as possible in the summer, following harvest of the previous crop, but by the end of August.

#### SPECIFICATION

SPECIES	% (seeds/m²)
Linseed	33.9
Buckwheat	8.5
Phacelia	18.6
Hairy vetch	6.8
Crimson clover	32.2

SPECIES	% (seeds/m²)
Linseed	18.1
Fodder rape	12.5
Smart radish	10.4
Stubble turnip	13.9
Winter vetch	10.4
Crimson clover	34.7

# **MaxiGraze**

### Seed Rate: 15 kg/ha (25kg pack)

MaxiGraze is the ideal choice for those wishing to strike a balance between improving soil health and providing better forage for grazing.

Single-species forage crops grown over-winter deliver very few of the key soil health benefits that a multi-species cover crop does. Generating forage for sheep or cattle is important for some, so with this mix you have the option to do both.

Forage rape, smart radish and stubble turnip are three brassica species which provide the bulk of the forage in this mix. Due to their three different growth habits, canopy and root types, they still satisfy the requirement for diversity within the mix.

Smart radish has a thick tap root but also has lateral roots which explore the soil horizontally. It also produces a large amount of top growth for forage.

Winter vetch and crimson clover provide quality forage as well as Nitrogen fixation and further diversity of root growth. Linseed, whilst not as palatable as the other species, will be grazed and provides the all-important soil stability from its fine, fibrous root system.

### SPEAK TO US FOR SPECIFIC ADVICE ON THIS MIX

🕲 t: 01526 832771 e: seedorders@hlhltd.co.uk www.hutchinsons.co.uk

# **MaxiSpectrum**

### Seed Rate: 40 kg/ha (25kg pack)

MaxiSpectrum delivers maximum species diversity with 15 species from five plant families: forbs, brassicas, legumes, cereals, grasses and chenopods.

The plants in this mix will provide many different types of canopy architecture, root structure and growth habit which in turn provide a multitude of benefits to the soil, environment and following crop.

Every root type explores the soil in a different way and to different depths which helps to create excellent friable soil. The range of species all have their strengths in terms of extracting nutrients from the soil which means that overall nutrient cycling should be enhanced for the benefit of the following cash crop. Each species also produces slightly different root exudates and therefore interacts with soil microbes in their own unique way. This should result in an uplift of the total microbial population as well as supporting a more diverse population.

**MaxiSpectrum** also includes the "magic five" species recommended by Dr Caligari, a Brazilian scientist and leading expert on cover crops, who suggests that these five plant families grow symbiotically together and produce a mass of phenolic compounds. These compounds are powerful antioxidants, they stimulate soil life and fast track the formation of humus and therefore soil structure.

#### SPECIFICATION

SPECIES	% (seeds/m²)

Sheeps burnet	4.5
Black medick	2

# **MaxiFruit**

### Seed Rate: 35 kg/ha (25kg pack)

Soil between fruit rows is frequently run on by machinery through the growing season, which can cause compaction problems in orchards, hop yards and vineyards.

MaxiFruit has been developed to provide all the benefits of cover crops, as well as hold up machinery better through its deep and diverse root types.

It is a perennial, grass-based mix that also includes a number of legume and herb species. The species don't grow too tall so avoid potential agronomic issues. During the growing season it can be mown to manage the height which gives the opportunity to throw the cuttings under the fruit trees, providing a weed suppressive mulch and also contributing nutrients and organic matter.

@ Æ 10

(2) t: 01526 832771 e: seedorders@hlhltd.co.uk www.hutchinsons.co.uk

### **CATCH CROP MIXES**

# **MaxiInterCrop**

### Seed Rate: 11 kg/ha (25kg pack)

MaxiInterCrop is designed to provide shorter term summer cover in a variety of situations on all soil types.

This mix may be used in front of an autumn sown cash crop, for example, after carrots harvested winter/early spring, after vining peas, or after wholecrop cereals (AD or feed).

This mix contains forbs, legumes, brassicas and also a C4 plant in the form of millet, a warm season grass species. C4 plants thrive in the warmer summer months and develop fantastic root systems in a short period of time as well as fixing significantly more carbon than C3 plants. High levels of sugary root exudates offer a great food source for soil microbes. C4 plants also have a high drought tolerance.

This mix can be established from late April onwards but may require managing well in advance of the following crop to prevent it going to seed.

#### SPECIFICATION

# **CATCH CROP MIXES**

#### SPECIFICATION

SPECIES	% (seeds/m²)
Buckwheat	23.5
White mustard	21.2
Berseem clover	55.3

# **MaxiCatchCrop**

### Seed Rate: 11 kg/ha (25kg pack)

MaxiCatchCrop can be used on any soil type and is designed to fill a gap of approximately six – eight weeks between cash crops. Between Oilseed Rape and Winter Wheat is a good example, providing a way of capitalising on every opportunity in the rotation to introduce diversity and living roots. This mix has also been effective as a late sown option when timings are compromised due to its fast-growing species. Cereals can be added to bulk it out.

All three chosen species are fast to establish and grow away quickly, a very important characteristic considering the short growing window.

**Buckwheat** is very effective at scavenging for phosphate and has the potential to increase P availability in the rhizosphere. It is also the fastest establishing cover crop species of all those used in the Hutchinsons range.

**Berseem clover** has impressed with its speed of growth and vigorous rooting, and brings the added benefit of Nitrogen fixation.

White mustard is the fastest growing of the mustard species and provides good biomass as well as a strong tap root.

This mix must be sown immediately behind the combine in order for it to be as effective as possible. Soil moisture levels must be considered and will determine the success of establishment.

### **CATCH CROP MIXES**

# **MaxiImpact**

#### Seed Rate: 11 kg/ha (25kg pack)

MaxiImpact is designed to do exactly that, make a visual impact. The six species chosen for this mix produce a range of vibrant colours during flowering to deliver a powerful visual impact in the landscape as well as providing a pollen and nectar source, a haven for birds, pollinators, beneficial insects and natural predators.

There are a number of opportunities to utilise this mix across the farm including along headlands of cash crop fields to encourage beneficial insects, or as part of a wildlife corridor through the farm. It could also be planted on the internal headlands of vegetable fields or around the outside of vineyards and orchards.

Again, diversity of species is delivering multiple benefits to both soil life and the life above the soil. A range of flowering periods will provide high quality habitat throughout the summer.

This mix is designed to be drilled from late April onwards and last through to the autumn.

#### SPECIFICATION

13

# **COMPANION CROP MIXES**

# **MaxiCompanion**

### Seed Rate: 5 kg/ha (25kg pack)

### Companion species are increasingly used in various crops which can have a number of positive effects.

Hutchinsons has introduced this companion mix for use with Oilseed Rape (OSR), specifically for the following reasons:

- To introduce species diversity to a monoculture crop.
- To provide a nectar source in OSR crops during late summer.
- **Buckwheat** and **berseem clover** are fast growing species with vigorous root systems, this can help the OSR roots to develop quicker by following the root channels of the companion plants.
- **Buckwheat** has the potential to increase P availability in the rhizosphere.
- Berseem clover fixes atmospheric N which will in turn be made available to the OSR crop.

**MaxiCompanion** can be added to the OSR seed and drilled together, or separately for those who have a drill with split hoppers.

Companion species are susceptible to frosts. Discuss herbicide strategies with your Hutchinsons agronomist to get the best from this mix.

# **COMPANION CROP MIXES**

# **MaxiUnderstory**

#### Seed Rate: 5 kg/ha (25kg pack)

Our MaxiUnderstory mix has been designed to fulfil the dual needs of rapid establishment and long term durability.

Mixtures consisting solely of white clover can be very slow to establish but once established can be overly competitive with the cash crop we intended it to support. To avoid the undesirable element of being too competitive once established, our **MaxiUnderstory** mix is made up with 40% small and medium leaved white clover.

Five other legume species are included of short and medium term lifespan partnered with fast and intermediate establishment periods. This allows for a phased establishment and sward duration to optimise the performance of this crop partnering rotational option. The phased approach to establishing the long-term white clover element means that the final clover population is supportive rather than competitive with the cash crop.

Containing six flowering species allows for Sustainable Farming Incentive (SFI) NUM3 legume fallow funding to be utilised during the establishment phase. Flexibility within the SFI means that NUM3 funding could be applied for one, two or three years before the established understory is utilised within the cash crop rotation.

The fast establishing, early flowering components of this mix will meet the objectives of NUM3 in the first year.

Siting and establishment of **MaxiUnderstory** should be well considered and planned in advance as this is intended as a rotational option of at least five years duration before reseeding may be required. It is therefore of key importance that compromised soil conditions or large background weed population situations should be avoided.

# Percent of label seed rate by drilling date

These rate adjustments relate specifically to the Hutchinsons range of mixes and should not be transferred to other cover crop mixes.

t: 01526 832771 e: seedorders@hlhltd.co.uk www.hutchinsons.co.uk

### **Grazing notes**

While all our catch and cover crop mixtures can be grazed, the presence of buckwheat, when actively growing, can cause a photosensitive reaction in pale faced livestock or exposed skin.

The level of buckwheat varies by mix and livestock will not preferentially graze buckwheat where inclusion levels are low.

Buckwheat is highly sensitive to frost so where grazing is intended it is best to utilise crops after frost has effectively controlled the buckwheat.

The majority of catch or cover crop mixtures will only provide maintenance forage levels. Where forage is required for weight gain or where early entry grazing is required then **MaxiGraze** should be utilised.

For sheep, grazing is restricted to adult animals and store lambs of at least six months of age.

Ewes with lambs still on milk must not be grazed on mixed species cover crops, including the **MaxiGraze** mix.

t: 01526 832771 ( e: seedorders@hlhltd.co.uk ( www.hutchinsons.co.uk (

### Do you know the nutritional value of your cover crop?

### Cover crops are often overlooked as a source of nutrients for grazing animals or the following cash crop.

Our nutrient capture service makes it possible for you to put a figure to the potential nutrition provided by your cover crop, helping you to make informed management decisions.

How the nutrients are cycled depends on how you manage the cover crop. Crop destruction can greatly affect the availability of the nutrition. Where possible you should graze with livestock or roll the cover crop down whilst still green, which enables easier chemical destruction later.

### For more information, speak to your agronomist or our Healthy Soils team on soils@hlhltd.co.uk

18

# **Agri-Environmental Schemes**

The Sustainable Farming Incentive (SFI) pays growers to maintain sustainable farming practices which go above and beyond basic regulatory requirements.

The scheme can protect and enhance the natural environment alongside food production whilst supporting farm productivity. The SFI scheme has been broken down into themes which create a menu of actions in a 'pick and mix' approach, some of which can be rotated and moved around the farmed area

For more information, speak to your agronomist or our Environmental Services team on enviro@hlhltd.co.uk

www.hutchinsons.co.uk/our-services/environmental-services

**t:** 01526 832771  $(\mathfrak{D})$ e: seedorders@hlhltd.co.uk www.hutchinsons.co.uk

Occasionally, shortages of seed of some cover crop species may occur throughout the season. We therefore reserve the right to alter the specifications of any of the mixtures in this range should a shortage occur. We will always ensure that any alterations do not render a mixture unsuitable for its intended use.

Any alteration to the mixture will be clearly shown on the bag label.

Our standard terms and conditions apply, these are outlined on the reverse of our invoices.

Your local Hutchinsons agronomist is able to provide you with advice and guidance, as well as supply the mixes that have been mentioned here.

Contact us for more information on our products or services.
